Talk overview

- ◆ Stability: A new principle in dense/sparse matching.
- ◆ Gives us: “**Matching at a given confidence level**” with ambiguous matches rejected.
- ◆ Simple.

Our programme

- ▶ complex scenes
- ▶ rich visual texture
- ▶ non-surfaces at camera resolution
- ▶ strong continuity model fails

Our programme

- ▶ complex scenes
- ▶ rich visual texture
- ▶ non-surfaces at camera resolution
- ▶ **strong continuity model fails**

- ◆ regularize differently:
strong occlusion model

- ◆ reliable matches only

- ⇒ needs uncertainty representation

Signature-based (Area-based) matching

Signature-based (Area-based) matching

is match p good? : $c(p) = \text{similarity} \left(\begin{array}{c} \text{[signature]} \\ \text{[signature]} \end{array} \right)$

Signature-based (Area-based) matching

is match p good? : $c(p) = \text{similarity} \left(\begin{array}{c} \text{[patch]} \\ \text{[patch]} \end{array} \right)$

confidence interval $[c_{\min}(p), c_{\max}(p)]$

Inhibition relation over tentative matches

$$p = (i, j) \in P$$

pair = tentative match

Inhibition relation over tentative matches

$$p = (i, j) \in P$$

$$X(p) \subseteq P$$

pair = tentative match

inhibition X -zone

uniqueness \rightarrow matchings

[Marr 74]

Inhibition relation over tentative matches

pair = tentative match

inhibition X -zone
 uniqueness \rightarrow matchings
 [Marr 74]

inhibition F -zone
 monotonicity \rightarrow ordering
 [Yuille & Poggio 84]

Inhibition relation over tentative matches

$$p = (i, j) \in P$$

$$X(p) \subseteq P$$

$$F(p) \subseteq P$$

pair = tentative match

inhibition X -zone

inhibition F -zone

uniqueness \rightarrow matchings

monotonicity \rightarrow ordering

[Marr 74]

[Yuille & Poggio 84]

- ◆ $q \in Z(p) \Rightarrow p, q$ mutually exclusive pairs (due to occlusion)
- ◆ their confidence intervals **overlap** \Rightarrow **no preference** between the pairs
- ◆ their confidence intervals **disjoint** \Rightarrow one pair **preferred** to the other

A new matching constraint: Stability

matching problem \rightarrow inhibition relation

$$\forall p : Z(p)$$

A new matching constraint: Stability

matching problem \rightarrow inhibition relation \rightarrow edge orientation

confidence level
 \downarrow

$$\forall p : Z(p)$$

strong: oriented to the preferred pair
weak: unoriented

A new matching constraint: Stability

matching problem \rightarrow inhibition relation \rightarrow edge orientation \rightarrow **stable matching M**

$$\forall p : Z(p)$$

strong: oriented to the preferred pair
weak: unoriented

Def. 1. Matching M is **stable** (at confidence level α) iff:

For **every** edge leaving M there is an **oriented** immediate successor returning to M .

Stable matching properties

- ◆ **Existence:** For any given confidence level stable matching **exists uniquely**

Stable matching properties

- ◆ **Existence:** For any given confidence level stable matching **exists uniquely**
- ◆ **Optimality:** Every occluded pair has a strongly better matched pair in its inhibition zone.

Stable matching properties

- ◆ **Existence:** For any given confidence level stable matching **exists uniquely**
- ◆ **Optimality:** Every occluded pair has a strongly better matched pair in its inhibition zone.
- ◆ **Density:** Not complete (**rejects ambiguous matches**)

Stable matching properties

- ◆ **Existence:** For any given confidence level stable matching **exists uniquely**
- ◆ **Optimality:** Every occluded pair has a strongly better matched pair in its inhibition zone.
- ◆ **Density:** Not complete (**rejects ambiguous matches**)
- ◆ **Algorithm:** is simple, $O(d^2n)$ (see the paper)

Results: Apple Tree

- ◆ 800×1100 image
- ◆ disparity range 50..100
- ◆ 5×5 correlation window + MNCC
- ◆ confidence interval width 0.5% of MNCC range
(in the paper: $\alpha = 20$, $\beta = 0.01$)
- ◆ 1.5min 1GHz K7 CPU

Changing confidence level

confidence interval width 0% [of NCC range]

Changing confidence level

confidence interval width 0.5% [of NCC range]

Changing confidence level

confidence interval width 1.5% [of NCC range]

Changing confidence level

confidence interval width 2.5% [of NCC range]

Changing confidence level

confidence interval width 5% [of NCC range]

Conclusions

- ◆ **Stability is a property** of tentative match subsets / no cost functional
- ◆ **Ambiguous matches rejected** 'at given confidence level'
- ◆ **Low error rate:** would be ranked 1st–4th on the Middlebury Dataset

<http://www.middlebury.edu/stereo/>

- ◆ **Flexible:** leaves space for many generalizations:

- sparse matching  bootstrapped wide-baseline stereo

- increasing matching problem dimension  tracking

- graph orientation weakly constrained

 multi-source evidence combination

- ◆ . . . opens many questions . . .
